

Problem

We need to amend one of the automatically generated controllers. All users should be able to view the field but only an admin can update it using the app or via direct calls to the REST API. This was not possible by implementing the existing partial methods provided.

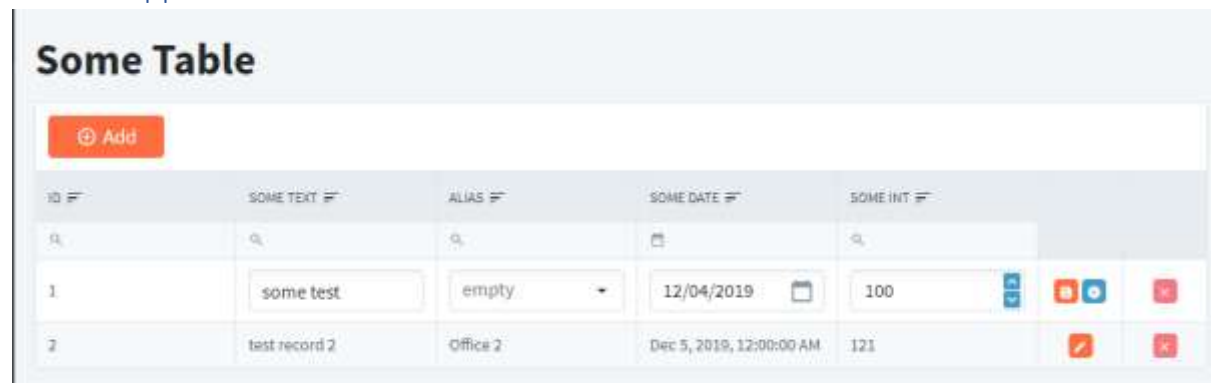

Radzen version 2.23.4

OS Win 10

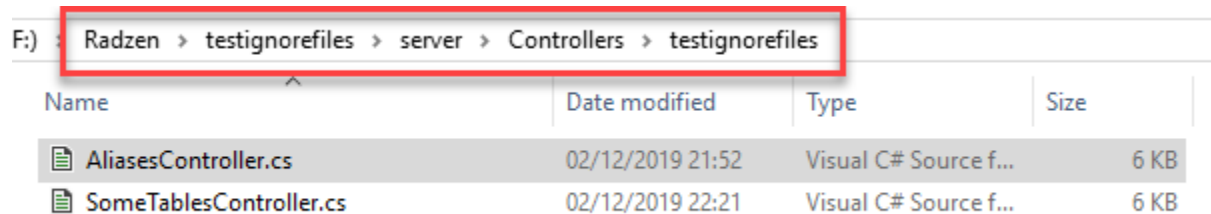

Database script and project meta file attached.

Simplified Example to reproduce

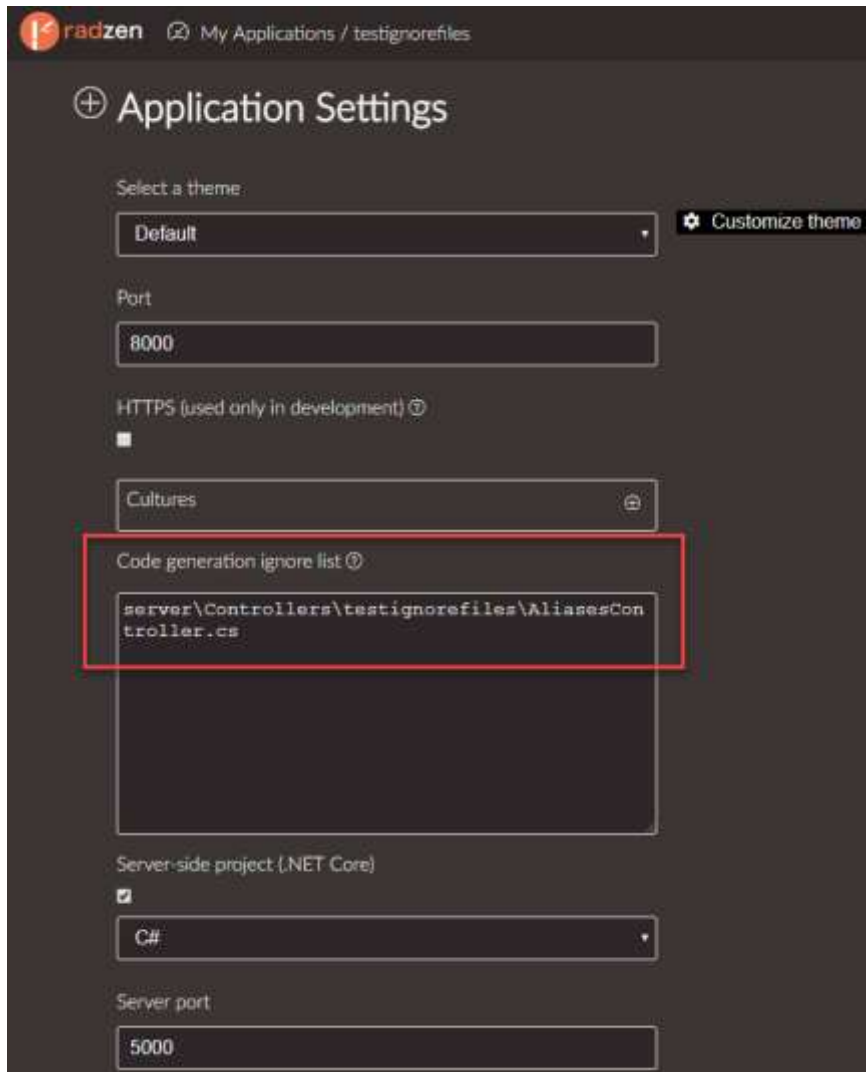

#1 -Run application

#2 - Open datasource controller folder using windows explorer and note 2 controller files

#3 -Update Application settings to ignore autogenerated controller

radzen My Applications / testignorefiles

⊕ Application Settings

Select a theme

Default ⌵ ⚙️ Customize theme

Port

8000

HTTPS (used only in development) ⓘ

☐
